Thomson Electrak® Smart Linear Actuators
Electric Solutions Featuring Onboard Electronics for Enhanced Control
Designing Smart Machines Starts with Smart Tools

As the industrial world becomes increasingly connected, the designer’s need for intelligent components that can communicate with each other and operate without the need for manual interaction is growing. Thomson, a trusted manufacturer that has always been committed to staying ahead of the technology curve, is meeting this demand and helping to usher in a new generation of smart actuators.

**What are Smart Actuators?**
The crux of smart actuators begins with the integration of onboard electronics, which enables enhanced control functions that were previously external, such as switching, position feedback and system diagnostics, directly into the actuator. Newer actuators from Thomson incorporate microprocessor-based printed circuit boards with complementary software that allows communication between remote networks.

Smart Actuators Overview

**Electrak® XD**
Ushering in the next evolution of electric actuators, the Electrak XD is strong enough to take on hydraulic applications while, at the same time, be smarter, smaller and more efficient than competitive technologies. On top of its strength (up to 25,000 N loads), the XD offers extensive protection against even the harshest conditions and ingress, and features enhanced controllability and diagnostics via onboard controls. www.thomsonlinear.com/xd

**Electrak HD**
The Electrak HD sets the bar for the electric linear actuator platform. Onboard electronics can eliminate the need for standalone controls, higher power opens a wider range of hydraulic and pneumatic applications to electric conversion, and it meets the most extreme environmental acceptance tests. www.thomsonlinear.com/hd

Smart Actuator Feature Breakdown

It’s all about control. With onboard electronics allowing you to make standalone controls a thing of the past, a new world of interconnected possibilities awaits your machine designs.

The Thomson Electrak® Modular Control System (EMCS) is the foundation for the best onboard controls currently available in electric linear actuators, and includes standard and optional features such as built-in CANopen® or SAE J1939 CAN bus support. This level of control helps save design and installation time, as well as space and installation cost. Plus, a generous selection of control configurations can tailor your smart actuator to fit a wide breadth of heavy duty applications.

**Brushless Constant Speed Motor**

Brushless constant speed motors offer longer life, higher duty cycle and predictable cycle times as the speed is constant as long as the motor operates within its load limits.

**Analog Position Feedback**

A high-quality potentiometer with essentially infinite resolution and low noise provides a voltage signal for position and direction feedback.

**Digital Position Feedback**

An encoder provides either a single- or double-channel pulse train for position and speed feedback, which can be used to synchronize actuators via a control system.

**Speed Control**

This feature allows the actuator speed to be controlled via an analog input signal or as CAN bus commands to optimize the speed of every extension tube move.

**Low-Level Switching**

Onboard electronics limit current draw at switches or contacts to a maximum of 22 mA, enabling a simplified and less expensive system design. These low-current signals can be used to program actuators to extend, retract or stop the tube, providing a soft start. This improves safety by reducing the hazard of electrical shock, and puts less stress on system batteries and charging systems. An auto sleep feature also helps improve efficiency by reducing power consumption during idle or dwell periods.
**Force Feedback**
The force feedback function transmits the force applied to the extension tube over an analog signal or as a CAN bus message. In force-sensitive applications, this feature will allow the system to not go over or under the desired force.

**Programmable End-of-Stroke Limits**
This feature lets you program exactly how much of the full mechanical stroke of the actuator you want to use.

**Synchronization**
This option allows two or more actuators to share a load. Designers are able to take advantage of a more stable and potentially quicker lift, no additional guides, and improved handling of uneven loads. With these controls integrated into the actuators, installation and system wiring are simplified.

**Monitoring and Diagnostics**
Constant monitoring of critical parameters such as voltage, speed, force and temperature protects the actuator and machine by preventing motion if outside normal ranges. Current monitoring is a critical safety feature that shuts down the actuator on overload and eliminates the need for the traditional noisy mechanical clutch. Internal end-of-stroke limit switches are built into select actuators to ensure smooth, repeatable operation and protect both connected equipment and the actuator.

**Simplified Control Architectures**
When adding CAN bus, your control system and actuators can communicate directly with each other. The installation is fast and easy, requiring only a two-wire bus cable and power to extend the network, and any other equipment with CAN bus can be connected for additional communication. The result is a less complex system to design, better performance and controllability, and reduced installation time and overall cost.

**Remote Access and Communication Protocols**
Integrated electronics make it possible for actuators to apply networking standards, such as CANopen or SAE J1939, high-level communications protocols that provide a standard messaging structure for communications among network nodes under control of an electronic control unit. While these protocols are popular for off-highway applications, actuators with integrated electronics are increasingly applied in plant floor, material handling and other applications.
Reaching New Markets and Applications

Smart actuators are increasingly finding their way into applications that were once dominated by pneumatic and hydraulic systems. The mobile off-highway (MOH) vehicle market was among the first to deploy electric actuators for enhanced control and automation capabilities available in the field. However, other industries have begun to realize the many benefits of smart actuators.

Smart Autonomous Vehicles on the Move

When vehicles are designed to move autonomously and communicate with operators and other machines within an integrated system, smart actuators are given a golden opportunity to shine. Not only do these actuators provide users with a multitude of enhanced control options, they help ensure the safety of the vehicles and any nearby workers.

Taking ‘Smart’ to the Next Level
Not just any actuator can deliver the performance and intelligence required by autonomous vehicles. You can find Thomson smart actuators in machines such as AGVs, logistics trains, work platforms, automated pickers, and wheelchair lifts and ramps.

For further detail on autonomous vehicle applications that benefit from smart actuators, see the next page.
Autonomous Vehicles at Work Everywhere on the Globe

**Indoor and Outdoor Material Handling**
- Autonomous vehicles such as logistics trains and forklifts can benefit from the enhanced controllability of Thomson smart linear actuators. This capability, which includes bus communication, feedback and diagnostics, allows the actuators to work with a central computer and other smart components for improved logistics flow. It also directly impacts waste reduction, and time and energy savings.
- For AGVs without human involvement, remote control over radio, WiFi, satellite and other communications is vital. In addition to their remote benefits, smart actuators reduce maintenance and environmental concerns thanks to sturdy designs. This all-in-one actuator package makes it possible for AGVs to move goods over larger areas no matter how demanding the conditions.

**Gardening, Cleaning and Utility Vehicles**
- Electric actuators are designed to handle the repetitive movements on these automated utility vehicles with the added benefit of a robust design that can handle dirty and wet environments, as well as integrated controls to ensure proper autonomous movement.
Drones

- Electric actuators automate remote stations like this drone platform to allow deployment in otherwise hard-to-reach areas. All the while, onboard diagnostics ensure the machines are in good working order.

- Automating movement of mobile drones with no human involvement is a prime candidate for electric actuators as they are maintenance free.

Charging, Filling and Emptying

- Applications like this docking mechanism for large ferries are sometimes dangerous and cumbersome for human involvement. Automating these ferries raises the demand for an automated system even more, and Thomson smart electric actuators make the most sense as they are fully controllable, maintenance free, and can easily communicate with other mechanisms (like the ferry itself) via bus communication.
Take Smart Actuators On and Off the Highway

On land, water or any other terrain, efficient linear motion control on vehicles, machines and equipment helps keep businesses moving. In these applications, you will find smart actuators making their biggest impact.
Actuators on the Move

Whether it be for agricultural vehicles, marine vessels or public transportation, smart actuators are an excellent choice for a wide array of tasks. These help increase productivity and quality, improve safety and ergonomics, and reduce fuel and maintenance costs.

For further detail on on/off-highway applications that benefit from smart actuators, see the next page.

Building a Smarter Factory

An interconnected factory is a productive, efficient factory. Once smart actuators are introduced into a facility’s automation process, the benefits are immediate and exponential. Machine design is simplified with increased flexibility and plug-and-play functionality, control capabilities are enhanced, energy usage is decreased, maintenance and downtime experience significant reductions, safety and ergonomics improve, and overall costs are lessened.
Seamless Interconnectivity
The smart factory incorporates a number of interconnected machines and devices that take advantage of advanced actuator features to enable a fluid, synchronized and safe manufacturing process. These can include fork lifts, assembly/control stations and fixtures, AGVs, and components that can be easily and quickly adjusted on the fly.
