1. Introduction

1.1. RediMount™ System - Micron True Planetary™ gearhead products combine precise speed reduction and torque multiplication with ease of installation using the innovative RediMount system. The most flexible mounting system in the world, the RediMount allows error free mounting to any motor in just a few simple steps. It’s easy to use system features a specifically designed input housing and sleeve to accommodate all motor mounting dimensions.

1.2. RediMount™ Design - The Micron RediMount design provides:
- A self aligning hub to maintain concentricity between motor shaft and gearhead.
- All of the hardware required to mount up to your motor.
- A pre-installed pinion to eliminate setting procedure.
- A modular design to allow separate stocking of the gearhead and mounting kit.
- Flexibility in changing to alternate motors in the field.
- Interchangeability. The RediMount is not product specific so the same mounting kit can be used in any orientation.

1.3. Gearhead Express™ Program - Because of the flexibility of the RediMount system, Micron is able to offer industry best lead times and the ability to ship the most popular sizes in 24 hours with the Gearhead Express Program.

2. Recommended Tools

2.1. (1) Torque wrench with hex drive per Table 5.1.

3. Pre-Installation Inspection

3.1. Examine the unit for any damage, which may have occurred during shipping. Check the unit to ensure it meets your application’s requirements, such as shaft fit and ratio. In addition, make sure all parts are clean and free of any foreign material prior to assembly.

4. Mounting and Installation Procedure

4.1. A WARNING Whenever attempting to install this type of product, it is strongly recommended that the motor be put in a safe condition (power-off) prior to servicing. Failure to follow the instructions in this manual may result in product damage, equipment damage, and serious or fatal injury to personnel.

4.2. Preparation - Degrease motor shaft, input hub, bushing and mounting surfaces.

4.3. Bushing Installation - Slide the provided bushing into the input hub and align the slot in the bushing with the slot in the hub (a bushing may not be required or may already be installed).

4.4. Hub Positioning - Rotate the hub to align the access holes with the hub-clamping bolts.

4.5. Motor Orientation - Set the motor on a work surface or holding fixture with the output shaft facing straight up. Mounting the gearhead to the motor in any other orientation will usually lead to misalignment, a load on the input bearing and excessive noise. Note: Once mounted, the gearhead can be used in any orientation.

4.6. Keyway - If there is a keyway on the motor shaft, remove the key, align the keyway with the slot in the hub and slide the gearhead down onto the motor shaft (it is normal and by design that the RediMount pilot bore is oversized compared to the motor pilot).

4.7. Pre-Torque Hub Bolt Tightening - Tighten BOTH hub bolts to the pre-torque value indicated on Table 5.1.

4.8. Bolt Gearhead to Motor - Bolt the gearhead to the motor using the provided hardware.

4.9. Final Torque Hub Bolt Tightening - Gradually tighten the hub bolts in three steps, increasing the torque each time. The final torque of the hub bolts should be consistent with the value indicated in Hub Bolt Tightening Torques Table 5.1.

6. Maintenance

6.1. All Micron planetary gearheads are grease filled and lubricated for life with no maintenance required.
